at the core of the many debates throughout cognitive science concerning how decisions are made are the processes governing the time course of preference formation and decision from perceptual choices such as whether the signal on a radar screen indicates an enemy missile or a spot on a ct scan indicates a tumor to cognitive value based decisions such as selecting an agreeable flatmate or deciding the guilt of a defendant significant and everyday decisions are dynamic over time phenomena such as decoy effects preference reversals

and order effects are still puzzling researchers for example in a legal context jurors receive discrete pieces of evidence in sequence and must integrate these pieces together to reach a singular verdict from a standard bayesian viewpoint the order in which people receive the evidence should not influence their final decision and yet order effects seem a robust empirical phenomena in many decision contexts current research on how decisions unfold especially in a dynamic environment is advancing our theoretical understanding of decision making this research topic aims to review and further explore the time course of a decision from how prior beliefs are formed to how those beliefs are used and updated over time towards the formation of preferences and choices and post decision processes and effects research literatures encompassing varied approaches to the time scale of decisions will be brought into scope a speeded decisions and post decision processes that require the accumulation of noisy and possibly non stationary perceptual evidence e g randomly moving dots stimuli within a few seconds with or without temporal uncertainty b temporally extended value based decisions that integrate feedback values e g gambling machines and internally generated decision criteria e g when one switches attention selectively between the various aspects of several choice alternatives c temporally extended belief based decisions that build on the integration of evidence which interacts with the decision maker s belief system towards the updating of the beliefs and the formation of judgments and preferences as in the legal context research that emphasizes theoretical concerns including optimality analysis and mechanisms underlying the decision process both neural and cognitive is presented as well as research that combines experimental and computational levels of analysis

researchers studying decision making have traditionally studied the phenomenon in the laboratory with hypothetical decisions that may or may not involve the decision maker s values passions or areas of expertise the assumption is that the findings of these well controlled laboratory studies will shed light on the important decisions people make in their everyday lives this book examines that assumption the volume begins by covering four basic phases of decision making setting or clarifying goals gathering information structuring the decision and making a final choice comprehensive reviews of existing literature on each of these topics is provided next the author examines differences in decision making as a

master s thesis from the year 2013 in the subject psychology work business organisation grade 2 3 technical university of munich language english abstract when going for grocery shopping some consumers make up their minds about what to buy and write down shopping lists others just go into the supermarket and do not really think beforehand about the things they need although in both situations individuals engage in different ways of decision making on the purchase of groceries when coming home and putting things into the shelve they positively or negatively assess the things they bought whereas in some situations one gets a positive feeling because e g s he purchased all the products on the shopping list in another situation a consumer might end up being bored because s he just bought the groceries which are perceived as useful and did not listen to his her inner voice calling for more than just the fulfillment of utilitarian needs generally consumers can consciously do their purchases and decide for products after thinking on it or can consider a product s attributes and let their intuition decide in the interest of the consumer the question emerges how the consumer decides at best does a consumer receive greater satisfaction from consciously

elaborating about the products s he is facing or is it better not to think consciously when facing product choices this question is differently assessed by different models on decision making whereas some authors ajzen 2011 bandura 1986 1997 deci ryan 1985 payne et al 1993 emphasize consciousness in decision making there is also a large number of proponents of unconscious thought dijksterhuis 2004 dijksterhuis et al 2005 2006a 2006b 2006c levine 1996 bargh 2002 and wilson et al 1993 dijksterhuis and nordgren 2006b p 96 argue for the superiority of unconscious decision making by mentioning that conscious thought is constrained by the low capacity of consciousness which results in sub optimal choices with regard to food products this general superiority of unconscious thought is highly questionable on the one hand consumers constrain themselves in taking into account only specific products which respect certain criteria as e g with diabetics and food products with less sugar content on the other hand food products are also bought because consumers want to confirm their conscience by purchasing e g fair trade products which among other things are associated with a fair payment of farmers
